

# Blueriq 14 is released!

In this new major version we focused on keeping the underlying technology of Blueriq up-to-date to the current market standards to keep Blueriq secure and stable. We updated underlying technology blocks and we fully replaced the development tools, consisting of the Runtime dashboard and application debug toolbar. With this replacement, we resolved technical debt, enabling us to deliver more value in the future. For the front-end of the new development tools, we used our new design system, which we also use for the successor of Blueriq Studio (will be released later). While we were busy, we also replaced the start page to match our new design system. Available for download in the [Customers](#) section!
