Installing Blueriq fails during Keycloak setup

Problem

Rarely, the installation of Blueriq using the installer fails, executes a rollback, and stating `The string is missing the terminator: "`. in the log file.

This is caused by either a "-character (quotation mark) in the password provided by the user or in the client secret that is automatically and randomly generated by Keycloak.

Solution

Remove the Blueriq folder ("C:\Program Files\Blueriq16") from your filesystem and reinstall Blueriq avoiding a " character in the password.
